Hughston Diagnostics is located on the ground floor of the Main Clinic location in Columbus, GA. It utilizes a 1.5 Tesla GE MRI machine, which is accredited with the American College of Radiology, to perform all types of orthopaedic MRI exams.

Magnetic Resonance Imaging (MRI) uses a strong magnetic field and radio waves to create detailed images of the inside of the body. MRI does not use ionizing radiation, such as X-rays or CT scans. Before an MRI examination, the technologist will review your medical history and ask safety screening questions to determine whether MRI is appropriate for you. Patients should inform the MRI staff of any implanted medical devices, metal fragments, prior surgeries, or other conditions that may affect MRI safety.

All of our images are read by musculoskeletal specialty-trained radiologists. Magnetic Resonance Imaging is a type of scan that our physicians schedule when soft tissue, which cannot be seen as well on traditional radiographs, needs to be visualized. MRI is a non-invasive procedure, which takes about 30 to 45 minutes to complete and causes no known side effects.
